

Structure and functioning of the natural gas market in Belgium in a European perspective

Date: January 2007 – July 2007

Clients: Commission de Régulation de l'Electricité et du Gaz (CREG)

Country / Region: Belgium

The purpose of this study is to help CREG identify any artificial barriers that prevent Belgian gas markets from functioning efficiently. One of our key tasks will be to find evidence that these barriers exist. We then have to make recommendations about how to address these barriers. The study's recommendations will be open to public scrutiny and, if a convincing case for change can be made, it will be presented to the federal government of Belgium as evidence for policy change(s).
